Nine professors and a graduate student tell 35-tales in rhymed verse as they drive a van to a conference from the University of Montana to San Francisco, wedging in one ode to an earthworm, five other poems, and singing two original songs. In the spirit and style of Geoffrey Chaucer's "Canterbury Tales," they embark on a pilgrimage to reap knowledge at the Holy Grail of computer technology in Silicon Valley with one simple rule: "you can speak at any time so long as you speak in rhyme." The themes of the tales are as diverse as the group of reluctant pilgrims, professors Virgil Vulgate, Smokey Cloud, Inger Johnson, Lupe de Vega, Lolo Sandec, T. Osprey Munsch, Tommy Tornado, Lawrence Carrow, Buster White, and graduate student Jose Roberto, "Bob".

The Antarctic continent carries the greatest diversity of lake environments on the planet: freshwater and saline lakes, tidal freshwater epishelf lakes, lakes on ice shelves and glacier surfaces, and over three hundred subglacial lakes; extraordinary ecosystems that have been separated from the atmosphere for up to millions of years. This book provides a unique and cutting edge synthesis of Antarctic limnology, drawing together current knowledge on geomorphology, morphometry, chemistry, community structure and function. It emphasises throughout the value of these near-pristine ecosystems as barometers of climate change, showing how responsive and vulnerable they are to the indirect impacts of anthropogenic activity. Antarctic Lakes begins with an introduction to their physical, chemical, and biological characteristics, providing a basis for understanding the subsequent detailed chapters on different lake types, and ends with a chapter considering the application of new technologies to polar limnology as well as identifying future research directions.

This accessible text is suitable for both senior undergraduate and graduate students taking courses in Antarctic and polar limnology, and will also be of broad interest to researchers working in the areas of polar science, microbial ecology (and extremophiles), climatology, glaciology, and astrobiology.
