Clinical Neuroanatomy

The discipline of anatomy has had a pivotal influence on the history of medicine as it serves almost as the language of medicine. This concept has not been changed till today, but the modalities that we use to understand the subject have been significantly changed. This book is unique in that the essential contents are put together allowing one to browse through anatomical knowledge on a daily basis. It should also satisfy anyone who believes that medical faculty must follow a system which is educationally

sound. Developing an excellent anatomy curriculum, assessment system, and anatomy resource centre are key to success that will allow us to address the question of how do we teach anatomy? If we have to continue teaching an important subject such as anatomy to medical students, we must be innovative in terms of our approach of teaching in the presence of decreased contact hours to fulfil the curricular need of more integration. This book will target medical educationists and students who may find it easier to develop concepts in gross anatomy, embryology, histology and neuroanatomy. Since planning learning experiences, their

implementation and student assessment, are closely related activities, care is taken to develop a process for clinically-oriented multiple choice questions in anatomy that satisfy the theme and objectives of anatomy. The issues related to laboratory activities have also been addressed so as to emphasise objective-structured practical examination that is integrated and clinically relevant during the early period of the medical curriculum. The students perception has been brought to our attention and given a great focus. This book for the first time addresses education in anatomy and provides a great resource for medical schools engaged in problem-

based learning or integrated systems curriculums.

This book contains the written contributions to the program of the First International Conference on Computer Vision, Virtual Reality, and Robotics in Medicine (CVRMed'95) held in Nice during the period April 3-6, 1995. The articles are regrouped into a number of thematic sessions which cover the three major topics of the field: medical image understanding, registration problems in medicine, and therapy planning, simulation and control. The objective of the conference is not only to present the most

innovative and promising research work but also to highlight research trends and to foster dialogues and debates among participants. This event was decided after a preliminary successful symposium organized in Stanford in March 1994 by E. Grimson (MIT), T. Kanade (CMU), R. Kikinis and W. Wells (Chair) (both at Harvard Medical School and Brigham and Women's Hospital), and myself (INRIA). We received 92 submitted full papers, and each one was evaluated by at least three members of the Program Committee, with the help of auxiliary reviewers. Based on these evaluations, a representative subset of the Program Committee met to

select 19 long papers, 29 regular papers, and 27 posters. The geographical repartition of the contributions is the following: 24 from European countries (other than France), 23 contributions from France, 20 from Northern America (USA and Canada), and 8 from Asia (Japan and Singapore).

It is difficult to know what the true incidence of metastatic spinal cord compression (MSCC) is in England and Wales because the cases are not systematically recorded. However, evidence from an audit carried out in Scotland between 1997 and 1999 and from a published study from Ontario, Canada, suggests that the incidence may be up to 80 cases per million population per year. This would mean around 4000 cases per year in England and Wales or more than 100 cases per cancer network per year. The Clinical Resource and Audit Group (CRAG) audit clearly showed that there were significant delays from

the time when patients first developed symptoms until hospital doctors and general practitioners recognised the possibility of spinal cord compression and made the appropriate referral. The median times from the onset of back pain and nerve root pain to referral were 3 months and 9 weeks respectively. As a result, 48% of patients were unable to walk at the time of diagnosis and of these the majority (67%) had recovered no function at 1 month. Of those walking unaided at the time of diagnosis (34%), 81% were able to walk (either alone or with aid) at 1 month. The ability to walk at diagnosis was also significantly related to overall survival. At present, relatively few

patients with malignant spinal cord compression in the UK receive surgery for the condition. But research evidence suggests that early surgery may be more effective than radiotherapy in a selected subset of patients.
