IFRS Simplified Springer
This book commemorates

the 65th birthday of Dr. Boris Kovalerchuk, and reflects many of the research areas covered by

his work. It focuses on data processing under uncertainty, especially fuzzy data processing, when uncertainty comes from the imprecision of expert opinions. The book includes 17 authoritative contributions by leading experts.

You cannot afford to be in the dark when it comes to validating your analytical systems and lab software. Written by international laboratory and compliance expert Dr. Ludwig Huber, Validation

of Computerized Analytical and Networked Systems is an invaluable validation tool. Covering the initial writing of the validation plan through implementation, testing, and installation qualification, through ongoing calibration, performance qualification, and change control, the book provides guidance throughout the entire validation process. Huber pays special attention to 21CFR Part 11 electronic records and signatures compliance, including recommendations for

implementation and the scope of Part 11 for chromatographic systems. He discusses vendor assessment, covers the criteria and procedures for vendor audits, and includes vendor assessment checklists. He also explores the validation of complex networked systems and "office software" such as Macros, spreadsheets, and databases, and the operational compliance of legacy systems. The book contains everything you need to perform computer systems validation cost-

effectively and in a manner acceptable to national and international regulatory agencies.

This book offers a thorough and systematic introduction to the modified failure mode and effect analysis (FMEA) models based on uncertainty theories (e.g. fuzzy logic, intuitionistic fuzzy sets, D numbers and 2-tuple linguistic variables) and various multi-criteria decision making (MCDM)

approaches such as distance-based MCDM, compromise ranking MCDM and hybrid MCDM, etc. As such, it provides essential FMEA methods and practical examples that can be considered in applying FMEA to enhance the reliability and safety of products and services. The book offers a valuable guide for practitioners and researchers working in the fields of quality management, decision making, information science, management science, engineering, etc. It can also be used as a

textbook for postgraduate and senior undergraduate students.

This book contains papers on selected aspects of dependability analysis in computer systems and networks, which were chosen for discussion during the 16th DepCoS-RELCOMEX conference held in Wrocław, Poland, from June 28 to July 2, 2021. Their collection will be a valuable source material for scientists,

researchers, practitioners and students who are dealing with design, analysis and engineering of computer systems and networks and must ensure their dependable operation. Being probably the most complex technical systems ever engineered by man (and also—the most dynamically evolving ones), organization of contemporary computer systems cannot be interpreted only as structures built on the basis of (unreliable) technical resources. Their

evaluation must take into account a specific blend of interacting people (their needs and behaviours), networks (together with mobile properties, cloud organization, Internet of Everything, etc.) and a large number of users dispersed geographically and constantly producing an unconceivable number of applications. Ever-growing number of research methods being continuously developed for dependability analyses apply the newest techniques of artificial and

computational intelligence. Selection of papers in these proceedings illustrates diversity of multi-disciplinary topics which are considered in present-day dependability explorations.

This Second Edition discusses ways to improve pharmaceutical product quality while achieving compliance with global regulatory standards. With comprehensive step-by-step instructions, practical recommendations, standard operating procedures (SOPs), checklists, templates, and graphics for easy incorporation in a laboratory. This title serves as a complete source to the subject, and explains how to develop and implement a

validation strategy for routine, non-routine, and standard analytical methods, covering the entire equipment, hardware, and software qualification process. It also provides guidance on qualification of certified standards, in-house reference materials, and people qualification, as well as internal and third party laboratory audits and inspections.

This book covers the cross-disciplinary areas between management

issues and engineering issues relevant to implementation of Environmental Management Systems (EMS) to the ISO 14000 series standards. It summarises the requirements set by ISO14001 and considers the management and engineering policies needed to satisfy these requirements and achieve ISO 14001 certification. Unique approach by integrating environmental management and engineering considerations Avoids

overuse of complicated technical jargon Detailed coverage of measurement and calibration standards to meet ISO14001

The Impacts of Liquor Outlets in Manukau City CRC Press

This book considers the global discourses and debates about 'intoxication', engaging in critical academic

discussion around this concept. The problems in defining intoxication are considered, alongside the meanings of intoxication and how these meanings often differ across diverse drug using populations. The way that intoxication has been engaged with over the centuries has affected how particular groups are perceived and responded to, resulting in punitive responses such as drug prohibition, alongside harsh treatment of those who are seen to transgress societal norms and values. Therefore,

this collection seeks to unsettle dominant discourses about intoxication and to consider this concept in new, critical ways. Ways of being intoxicated are also defined in this book in their broadest sense; from 'energy drinks' and other legal drugs, to recreational use of illicit drugs such as ecstasy, to 'problematic' drug use. *ISO 14000 Environmental Management Standards* Springer
Dependability analysis is the recent approach to performance evaluation of

contemporary systems which tries to cope with new challenges that are brought with their unprecedented complexity, size and diversity. Especially in case of computer systems and networks such evaluation must be based on multidisciplinary approach to theory, technology, and maintenance of systems which operate in real (and very often unfriendly) environments. As opposed to “classic” reliability which focuses mainly on technical aspects of

system functioning, dependability studies investigate the systems as multifaceted and sophisticated amalgamations of technical, information and also human resources. This monograph presents selected new developments in such areas of dependability research as mathematical models, evaluation of software, probabilistic assessment, methodologies, tools, and technologies. Intelligent and soft computing methods help to resolve

fundamental problems of dependability analysis which are caused by the fact that in contemporary computer systems it is often difficult to find a relation between system elements and system events (the relation between reasons and results) and it is even more difficult to define strict mathematical models with “analytical” relationships between such phenomena. *Journalism* Nixon-Carre Limited

Language Structure and Environment is a broad introduction to how languages are shaped by their environment. It makes the argument that the social, cultural, and natural environment of speakers influences the structures and development of the languages they speak.

After a general overview, the contributors explain in a number of detailed case studies how specific cultural, societal, geographical, evolutionary and meta-linguistic pressures determine the development of specific grammatical features and the global structure of a varied selection of languages. This is a work of meticulous scholarship at the forefront of a burgeoning field of linguistics.

In modern distributed systems, such as the Internet of Things or cloud computing, verifying their correctness is an essential aspect. This requires modeling approaches that reflect the natural characteristics of such systems: the locality of their components, autonomy of their decisions, and their asynchronous communication. However, most of the available verifiers are unrealistic because one or more of

these features are not reflected. Accordingly, in this book we present an original formalism: the Integrated Distributed Systems Model (IMDS), which defines a system as two sets (states and messages), and a relation of the "actions" between these sets. The server view and the traveling agent's view of the system provide communication duality, while general temporal formulas for the IMDS allow automatic verification. The features that the model checks

include: partial deadlock and partial termination, communication deadlock and resource deadlock. Automatic verification can support the rapid development of distributed systems. Further, on the basis of the IMDS, the Dedan tool for automatic verification of distributed systems has been developed.
